

Online Food Delivery Platform

Literature Review, Gap Analysis & Proposed Solution

Review focus: relevance • depth of literature • critical synthesis • research gap • project novelty

2520090201 – M Vijayalakshmi

2520090211 – P Shashanth

2520090102 – D Pawan Kumar

1. Review–2 Evaluation Rubric

The presentation is structured to address all five 10-mark criteria

Relevance to Project Title

Literature directly supports an Online Food Delivery Platform.

Depth & Quality of Literature Review

Use peer-reviewed systematic reviews and recent studies.

Critical Analysis & Synthesis

Compare findings across customer, restaurant, delivery and technology perspectives.

Gap Analysis through Literature Review

Identify what existing research does not adequately integrate.

Presentation Skills

Clear progression: literature → synthesis → gap → proposed solution.

TARGET: 50 / 50

2. Relevance to the Project Title

Why the literature selected is directly connected to the proposed platform

01 Online ordering

Research examines online food delivery as a platform-enabled service connecting customers and food providers.

02 Platform ecosystem

Literature treats OFD as an ecosystem involving customers, restaurants, delivery operations and platform coordination.

03 Technology

Studies cover mobile apps, digital interfaces, real-time delivery operations, tracking and technology adoption.

Project title: Online Food Delivery Platform.

The literature therefore focuses on the same domain rather than unrelated food-service topics.

The project extends the domain into an integrated implementation with group ordering and split bill.

3. Literature Review Landscape

Major research streams identified in the literature

Consumer adoption

TAM / UTAUT / TPB, perceived value, convenience, effort and performance expectancy.

Platform experience

App design, interactivity, trust, service quality, security and satisfaction.

Restaurant perspective

Platform sales, restaurant participation, visibility and channel effects.

Delivery operations

Assignment, routing, scheduling, dispatching and real-time operational decisions.

Social / group ordering

Social interaction, usefulness, convenience and motivations for group-order functions.

Emerging technology

Mobile platforms, AI, optimization, tracking and future delivery technologies.

4. Key Literature – Systematic Reviews

High-value sources selected for depth and research grounding

Seghezzi, Winkenbach & Mangiaracina (2021)

Reviewed 59 papers from 2016–2020; emphasized an ecosystem view and highlighted gaps in restaurant operations, HR and logistics.

International Journal of Logistics Management

Choi et al. (2022)

Systematic synthesis of OFD literature; identified TAM, UTAUT and TPB as prominent theories and noted the evolution from websites to mobile and newer technologies.

International Journal of Hospitality Management

Gao et al. (2022)

Systematic literature review plus bibliometric/thematic analysis of OFD research; identified stakeholder complexity and future research themes.

International Journal of Contemporary Hospitality Management

Ashraf & Bardhan (2025)

Systematic review of order-fulfilment decision models; categorizes delivery/pre-delivery problems and notes growing use of optimization and machine learning.

International Journal of Production Research

5. Literature – Consumer Adoption & Experience

What makes customers adopt and continue using food-delivery platforms

Meta-analytic evidence (2024)

Performance expectancy, effort expectancy, social influence, facilitating conditions, interactivity and perceived risk are important. Perceived value influences intention, which connects to satisfaction, trust and loyalty.

India-Spain adoption study (2023)

A study of 422 users used the SOR model and PLS-SEM to examine intention and recommendation of online food delivery, showing the relevance of user attitudes and contextual factors.

IMPLICATION FOR OUR PROJECT

Interface usability and convenience must be treated as core design requirements.

Secure payment, transparent status and useful information can strengthen trust.

The platform should not focus only on ordering; the complete user experience matters.

6. Literature – Restaurants & Delivery Operations

The platform must coordinate more than the customer-facing app

Restaurant perspective

Research indicates online delivery platforms can affect restaurant sales and channel performance. Effects can differ by restaurant type and customer channel.

Delivery perspective

Recent reviews organize operational problems around assignment, routing, scheduling and dispatching. Optimization and machine learning are increasingly used.

Ecosystem perspective

Systematic reviews argue that customers, restaurants and delivery actors should be considered together rather than as isolated components.

Project response: separate customer, restaurant and delivery workflows are connected through a common backend and real-time order lifecycle.

7. Literature – Group Ordering

A newer research direction directly supporting our differentiating feature

Group-order adoption study (2025)

Research on group-order functions in mobile food-delivery apps examined motivations using 792 survey responses. App usefulness and convenience were important in users' commitment and intimacy with the app.

Project interpretation

The literature supports group ordering as a meaningful platform function. Our implementation adds a shared cart and split-bill workflow so participants can coordinate one order and divide the payment.

Create group

Shared order

Add items

Member ownership

Place order

One checkout

Split bill

Individual share

8. Critical Analysis & Synthesis

What the studies collectively tell us — and where they differ

Research focus	Strong finding	Limitation / tension	Design implication
Consumer adoption	Convenience, usefulness and perceived value matter.	Many studies are survey-based and measure intention rather than system-level outcomes.	Build a usable end-to-end workflow.
Platform experience	App design, interactivity, trust and security influence experience.	Different theories and contexts produce fragmented explanations.	Combine usability with secure transactions.
Restaurants	Delivery platforms can expand sales and reach.	Benefits vary by restaurant and channel.	Include restaurant-side management.
Delivery operations	Routing, assignment and dispatch are optimization problems.	Much work focuses on operations rather than integrated UX.	Connect operational status to customer experience.
Group ordering	Usefulness, convenience and social interaction can motivate group orders.	Less attention to practical split-payment workflows.	Implement shared cart + split bill.

9. Research Gap Identified

The gap is derived by comparing the themes across the reviewed literature

Fragmented stakeholder view

Studies often focus on one actor or one problem; fewer student-level prototypes integrate customer, restaurant and delivery workflows in one platform.

Operational vs user experience divide

Operations research emphasizes routing/assignment, while adoption research emphasizes attitudes and intentions. The two perspectives are not always integrated.

Group ordering implementation gap

Research is emerging on motivations for group orders, but practical shared-cart + member ownership + split-payment workflows receive less implementation attention.

Real-time integration gap

Tracking and real-time updates are important, but an integrated prototype combining ordering, payment, delivery status and group coordination remains a useful engineering contribution.

Academic implementation gap

There is value in translating literature findings into a demonstrable full-stack DBMS project with measurable modules and workflows.

10. Proposed Solution Based on the Gap

FoodFlow connects the literature findings into one implementation

1 Customer

Browse → cart → checkout → tracking

2 Restaurant

Menu → order acceptance → preparation

3 Delivery

Assignment → status → location tracking

4 Payment

Razorpay → transaction status

5 Real-time

Socket.IO → live order/group updates

6 Group order

Shared cart → member items → split bill

11. System Architecture & Literature-to-Feature Mapping

Each major literature theme maps to a project component

React.js

Usability & platform experience

Node.js + Express

Integrated backend

MySQL

Persistent transactional data

Socket.IO

Real-time status & group cart

Google Maps API

Location visualization

Razorpay

Secure payment / split payment

Literature → requirements → architecture → working modules → demonstrable outcome

12. Project Contribution & Novelty

What our project contributes as an implementation

Integrated platform

Combines customer, restaurant, delivery, admin, payment and real-time workflows in one prototype.

Group Ordering + Split Bill

A shared cart allows multiple participants to add items, track ownership and divide the final bill for individual payment.

Real-time coordination

Socket.IO supports live order status, delivery-related updates and shared group-order synchronization.

DBMS learning outcome

MySQL models users, restaurants, menu items, orders, order items, payments, delivery and group-order data.

13. Expected Outcomes & Evaluation

How the project can be demonstrated in Review-2

Demonstrate that the project title is strongly grounded in current OFD literature.

Explain at least four major literature streams and compare their findings.

Clearly state the research/implementation gap instead of only describing existing systems.

Show how the proposed architecture responds to the identified gaps.

Demonstrate the novelty feature: Group Ordering with Split Bill.

Use literature evidence to justify real-time updates, secure payments, tracking and multi-role design.
