REVIEW 3

Problem

Phone-based ordering can lack centralized order visibility, live delivery updates, coordinated payments, and a shared group-order workflow.

Proposed solution

A single web platform connecting customers, restaurant owners, delivery partners, and an administrator through a coordinated backend.

Project objectives

- Enable customers to browse restaurants, select food, place orders, and pay online.
- Allow restaurant owners to manage menus and incoming orders.
- Support delivery assignment, live order status, and map-based tracking.
- Introduce group ordering with a shared cart and participant-level bill splitting.
- Provide an admin view for onboarding, commissions, and platform-wide order management.

REVIEW 3

Technology choices follow the submitted project abstract.

Methodology & End-to-End Workflow

How a food order moves through the platform

Core process: request → validation → database update → real-time event → user-facing status.

REVIEW 3

Illustrative group-order sequence

Evaluation focus: shared-cart consistency, correct bill calculation, and reliable updates across participants.

REVIEW 3

Adaptability

- Role-based modules can be expanded without redesigning the complete platform.
- REST API and database-backed records support adding restaurants, menu items, and delivery partners.
- Socket.io can support additional real-time events such as notifications and delivery updates.

Accessibility & dissemination

- Use clear navigation, readable labels, form validation, and responsive layouts.
- Provide a demo walkthrough, architecture diagram, setup guide, and test cases for reviewers.
- Use test credentials and sample records for a repeatable demonstration.

REVIEW 3

Functional testing	Register/login, restaurant listing, menu, cart, order placement, role workflows
Database validation	Confirm user, restaurant, menu, order, and group-order records persist correctly
Real-time testing	Verify order-status and shared-cart updates appear for connected participants
Payment testing	Use Razorpay test mode/sandbox; verify success, failure, and status handling
Tracking testing	Verify map/location display and delivery status changes with test data
Usability testing	Check navigation, error messages, mobile-width layout, and form validation

Report actual test outcomes in the presentation; do not claim a test passed until it has been executed.

Implementation Evidence & Review Demonstration

Suggested live demo order

- Log in with a demo role and show the corresponding dashboard.
- Place a sample order and show the restaurant/delivery status flow.
- Create a group order, add items from two participants, and show the split calculation.

Conclusion & Next Steps

Review 3 takeaway

The platform brings ordering, restaurant processing, delivery coordination, and group ordering into one connected workflow.

- Complete and verify each role-based workflow.
- Validate database consistency and real-time group-cart updates.
- Test payment integration in sandbox mode and document outcomes.
- Capture interface screenshots and prepare a repeatable live demonstration.

Thank You
